

Ingolstadt, June 2nd 2015

Press Release

Schubert & Salzer takes over the valve business from damko and, consequently, is the sole European sliding gate valve manufacturer

Schubert & Salzer Control Systems GmbH, the sliding gate valve specialist from Ingolstadt is expanding its innovative product range of stop valves and control valves for liquid and gaseous media, that are used in a wide range of industries, with the segment disk valves and metering orifices from damko Ventiltechnik GmbH & Co. KG, Schaafheim. Through an asset deal, Schubert & Salzer Control Systems GmbH has acquired the entire "Valve and Measurement Technology" segment from damko Ventiltechnik GmbH & Co. KG and will integrate it into its headquarters in Ingolstadt.

The functional principle of the segment plate valves, which have been successfully applied in the field of sand-lime brick and aerated concrete manufacture as well as in the chemical and paper industries and during the construction of power plants and ships, is extremely similar to the well-known sliding gate valves from Schubert & Salzer. The valve specialists from Ingolstadt are consistently expanding their market position with the product range that has now been extended with the segment disc valves.

Both the segment disk valve and the sliding gate valve represent an ideal alternative to the traditional globe valves and are particularly characterised by its significantly lower weight, the compact dimensions, minimal wear as well as low leakage, reduced flow noise, high control precision and speed at a minimal inherent energy consumption. Simply genius!
